Stained Glass: A Basic Manual

Barbara Hand Clow Gerry Clow

Staining is a technique used in the field of histology and microscopy to enhance contrast in samples examined under the microscopic. Stains and dyes are frequently used in histopathology, the medical field that studies and diagnoses disease at a microscopic level. Stains may be used to define biological tissues (highlighting, for example, muscle fibers or connective tissue), cell populations (classifying different blood cells, or organelles within individual cells). In traditional stained glass, these are the thick black lines that outline the graphics. They are normally made from lead, which is black. I mixed about a tablespoon of black acrylic paint into my Elmer's white school glue bottle. I used a skewer and mixed it well to disperse the paint. I then began to trace. This takes awhile so make sure you're in a comfy spot. (; Once you're doing tracing everything, remove the printouts and you're left with your basic outlines! Next, you'll mix up your colors! I used Elmer's clear school glue, acrylic paint and a cupcake tin. Let's choose an already dened stained glass texture inside the Backdrop Designer plugin. Do this by going to the Combination Preset Manager button at top right (it looks like a square in a circle). For this tutorial, we chose the Sunrise at St. Chapele preset in the Stained Glass category. [gure 1].

Step 03. To make our stained glass believable, we will do a little more work beyond the preset that we've chosen. First, we need to isolate the Texture from the Shadow. You have the stained glass texture on a separate layer from your windows shapes. This means you can manipulate the two images independently. If we had applied our Combination preset onto one layer, without doing Steps 03-05, then we would not have the exibility to edit the glass image separate from the window image.
Lay your stained glass piece on a flat surface in the direction you would like it to hang. Slide the U-channel over the right edge. If it is too snug, use the curved end of your fid and open up the came. @cesarmchj Using a quality stained glass solder and stained glass flux can both help to give you the most even, shiny silver finish possible on your glass art. If you have been using a rosin-core solder or flux from a hardware store upgrade to stained glass products - your art is worth it. Even using stained glass quality supplies you may occasionally see black flecks develop when soldering caused by impurities in the flux. Once you have finished soldering your full project, use a flux remover and scrub your art. The black coloration should wash away, and the solder lines should appear clean. I use to make stained glass windows 20 something years ago, and just recently decided to take it up again and teach my 13 year old grandson how to make them. I realized I needed a little refresher, so when I found Basic Stained Glass Making: All the Skills...I was so thrilled. It was great for me, and of course, my grandson who was just starting. I don't make copper foil windows, but the step-by-step instructions for leaded glass is perfect. All about Stained glass: A basic manual (Little, Brown crafts series) by Barbara Hand Clow. Stains are classified as acidic, basic or neutral, depending on the nature of the stain's colored radicals. Acidic stains tend to react with cytoplasm, whereas basic stains are taken up by nucleic acids. Dishes, covers and racks are manufactured from soda-lime glass and resist stains from Eosin or Hematoxylin. Staining dishes are available in many configurations to accommodate up to 50 slides, with various glass and stainless steel racks. Coplin jars can be used for pre-staining with an alcohol buffer. Slides are held vertically for easy manipulation. This 20-slide unit is the standard for manual staining procedures, holds 10 single slides or 20 back to back. Removable glass slide rack has an open bottom for rapid immersing and draining of stain, eliminating any carryover.
